Open Agent Hackathon 2026 · Track 1: Solving Fragmented Intelligence

bundle.

Your first 100 days, checked.

Money back, recalls and deadlines for new parents. A team of AI agents argues over every claim before a parent sees it.

real app screenshot · sample family (fake data)

Solo build by Lyndsay Kerwin · Zetaris · Meterless · Built with Claude Code

THE PROBLEM

New parents leave money and safety on the table.

$441

lost per FSA holder who forfeits

About half of FSA holders lose money every year. Top reason: not knowing what counts.

~40%

of recalled car seats ever get fixed

Only 42% of parents register their seat, so most never hear about a recall.

56%

of WIC-eligible people enrolled

The "take-up gap": people qualify for help and never get it (2023).

And 2026 rewrote the rules: $1,000 Trump Account · $2,200 child tax credit · $7,500 dependent-care FSA limit · $440 MA child credit

Sources: EBRI via Retail Dive (FSA) · Safe Kids Worldwide (car seats) · CBPP, Mar 2026 (WIC) · IRS 2026 adjustments, Axios, HWH Law, Mass.gov via Kiplinger (2026 rules). Full links in the repo README.

What Maya's family is owed is scattered across five places.

Her bank
Card spending
A $28.99 thermometer: FSA-eligible, paid with a regular card

Amazon
Order history
A crib mattress that is on a recall list

Her employer
Benefits plan
30-day windows for insurance and dependent-care FSA

IRS + Massachusetts
2026 rules
Rewritten this year. Most parents' info is stale.

CPSC + FDA
Live recalls
Updated constantly. A week-old copy is dangerous.

Sample family (fake)
Baby Maya, day 20

Boston, MA. Parent works full-time with employer benefits. Nobody joins these five sources for her.

Insurance window: 10 days left

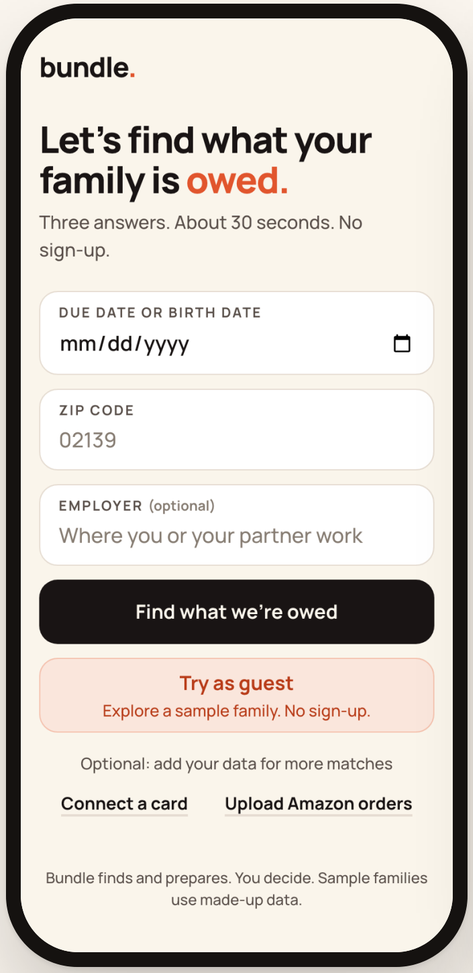

For: a working parent, expecting or within 100 days of a birth, with employer benefits. Demo state: Massachusetts; federal items work everywhere.

THE SOLUTION

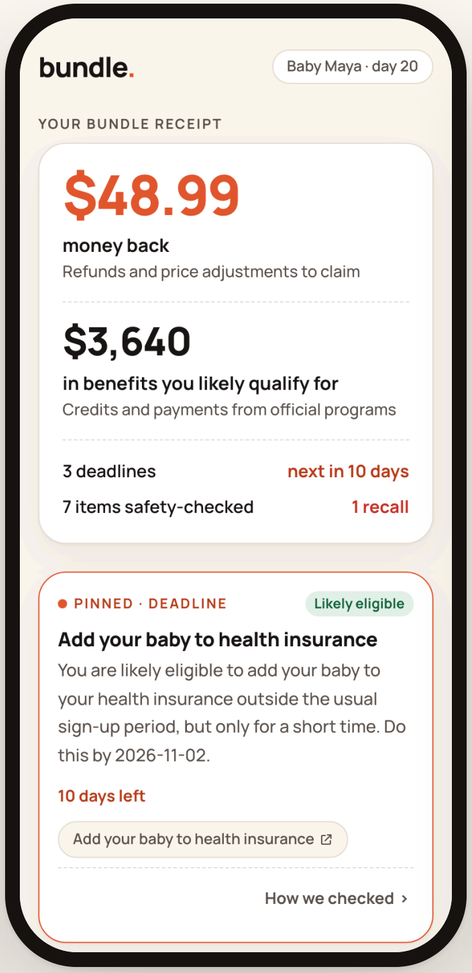

One screen. Everything she's owed.

Three inputs, or "Try as guest." Bundle joins her data with live public rules and returns one Receipt.

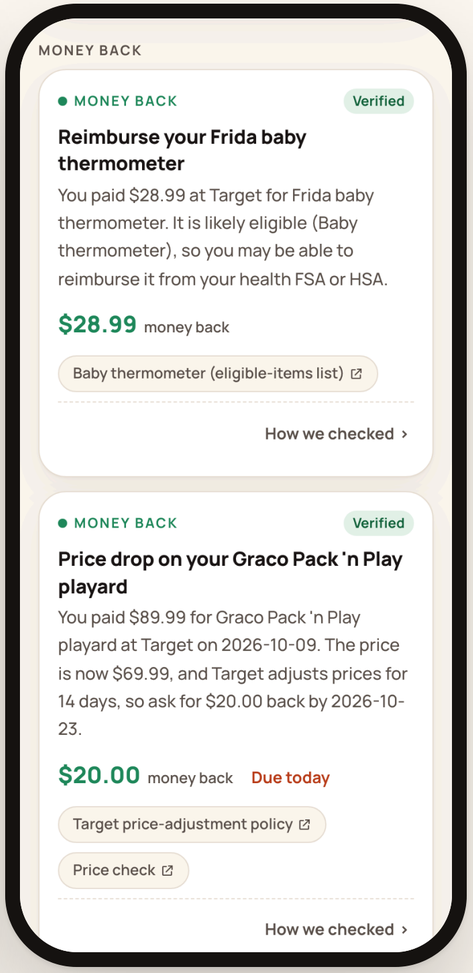

Useful with no bank connected. Connecting data is the upgrade.

1 · Onboarding

2 · Bundle Receipt

3 · Feed: money back

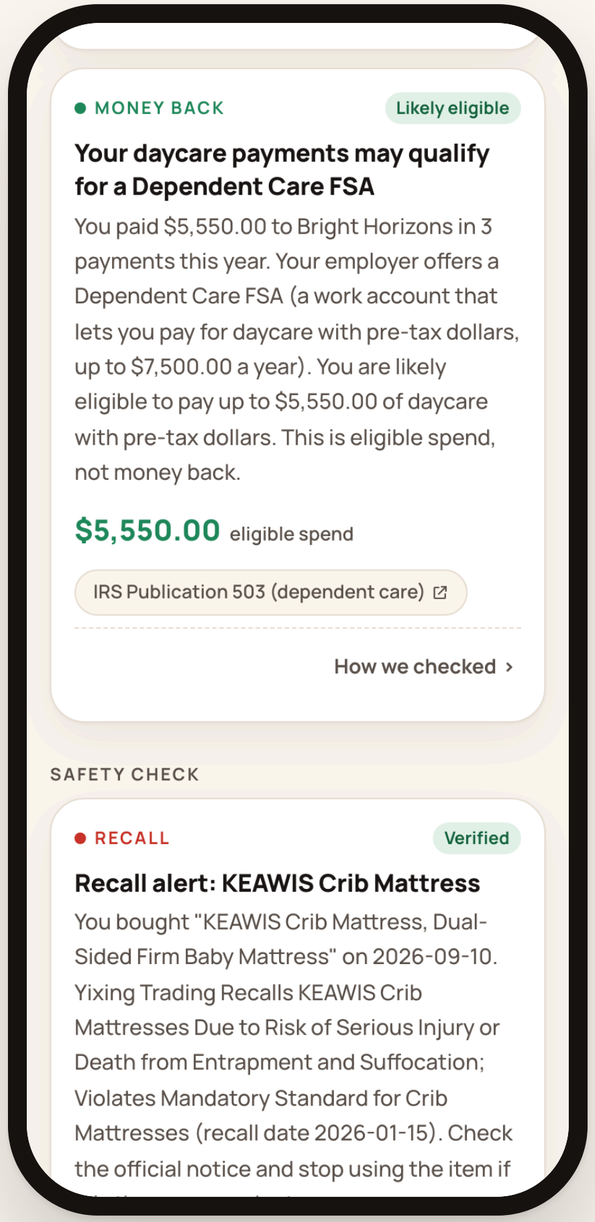

Real app screenshots · sample family, fake data

PRODUCT

Five kinds of cards. Every one shows its work.

- **Money back** · the hero
  FSA claims, store price adjustments, dependent-care FSA for daycare
- **Recalls**
  Her purchases checked against live recall feeds, or "We checked N items: all clear"
- **Benefits + deadlines**
  Dated countdowns: insurance window, Form 4547, MA paid leave
- **Discounts**
  Matched to baby's age and purchases. Each one survived Fine Print Court
- **Coming soon**
  Pre-filled applications · price-drop watching

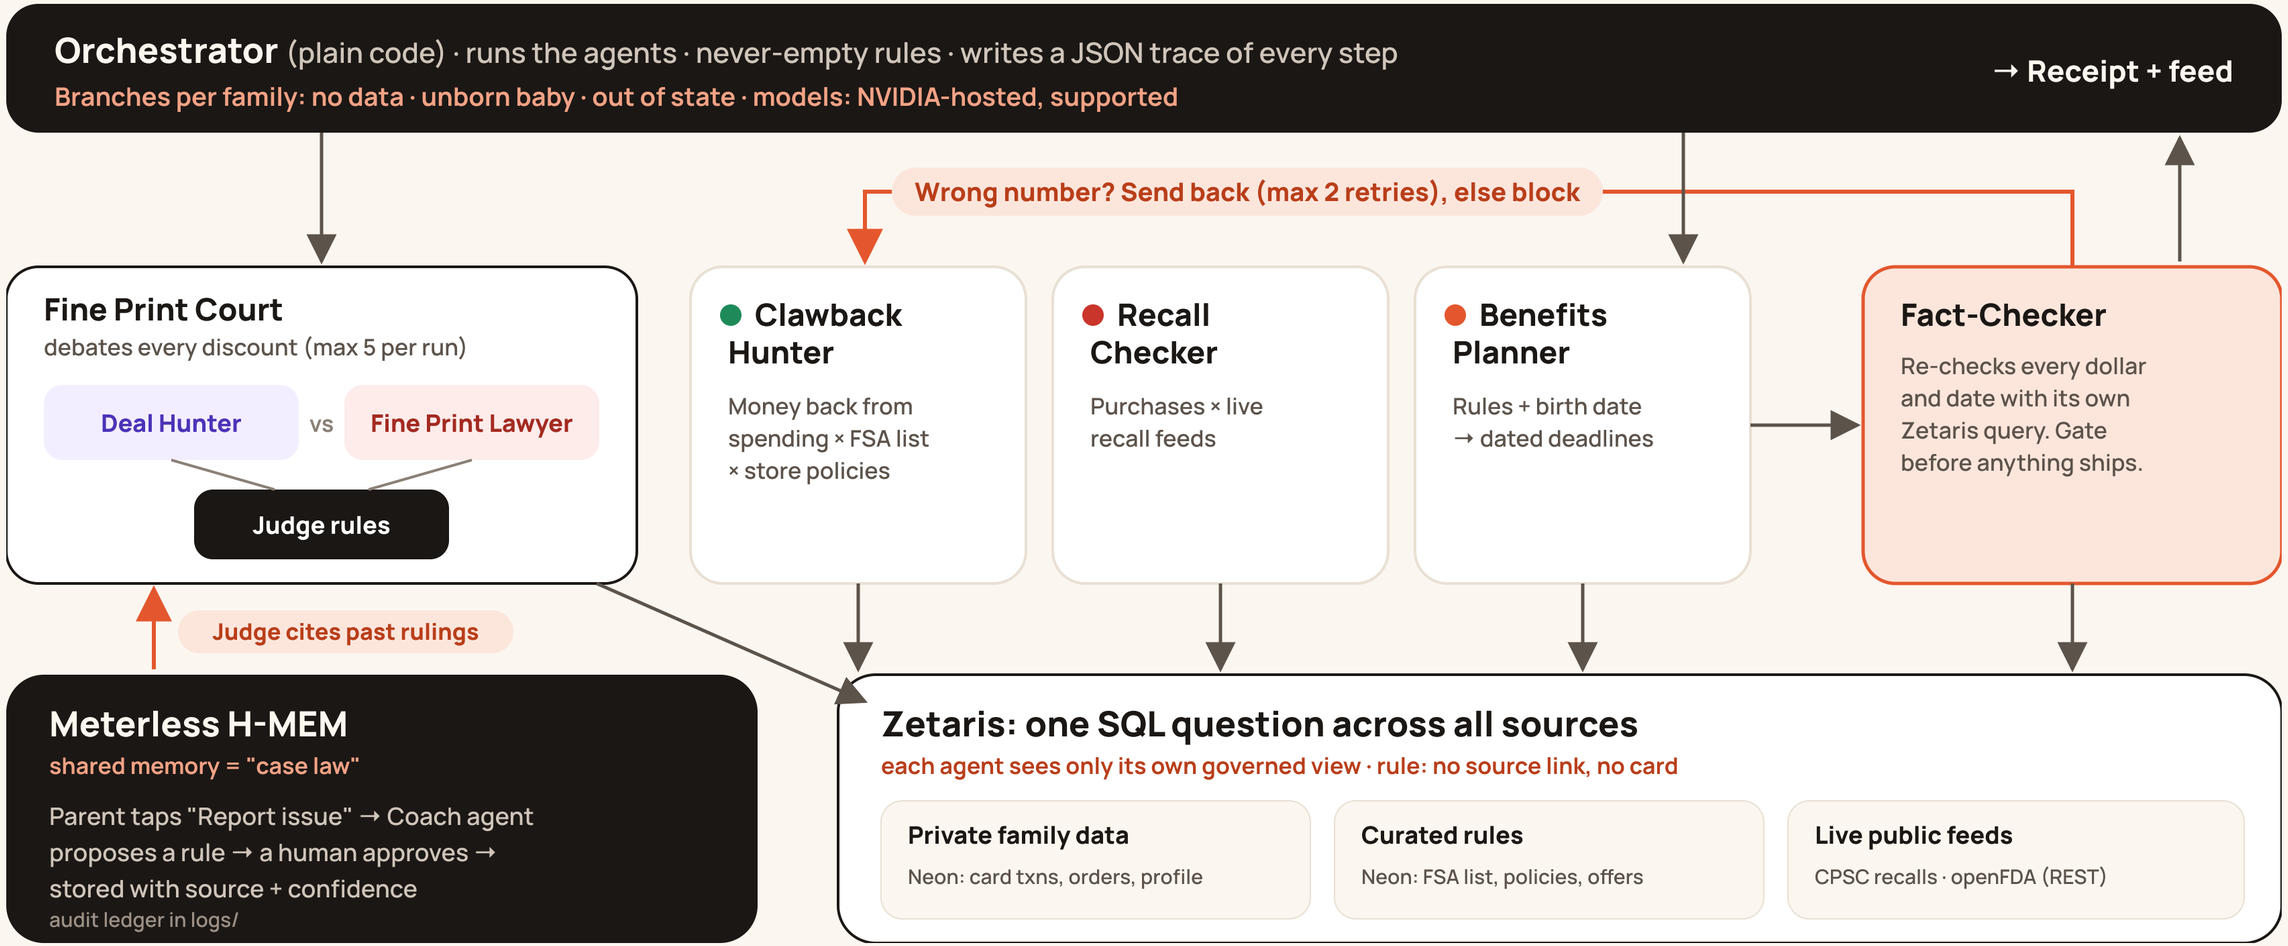

Never empty. No bank, no orders, baby not born yet? Every family still gets benefits, a recall check and court-vetted discounts.

real app screenshot · sample family (fake data)

AGENT ARCHITECTURE

A newsroom of agents, wired to one data door.

Math and deadlines are computed in plain SQL and code. Agents explain, argue and check.

AGENTS THAT CHECK EACH OTHER

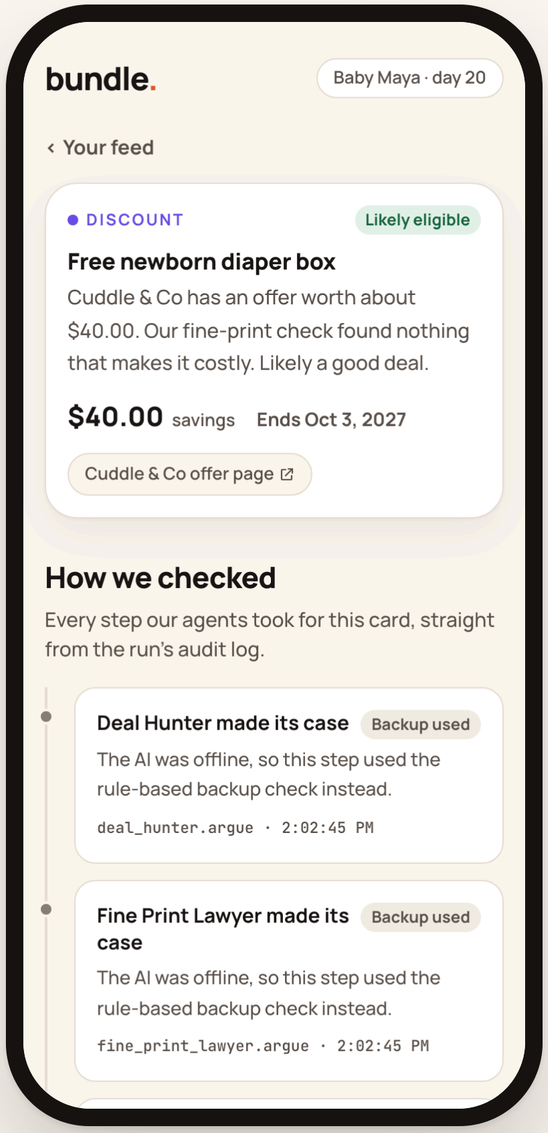

Nothing reaches a parent until it survives the court.

Run 1 · Judge Approves the "free trial" box: `"no flagged terms found. Not reviewed by the AI court."`

Reviewer Approves a rule: `"Reject offers whose free trial turns into a paid membership that renews automatically."`

Run 2 · Judge **Blocked.** `"case law applies ... [cited mem-1]"`

Fact-Checker Re-checks every dollar and date. Wrong? Sent back, max 2 tries, then dropped.

real "How we checked" screen · AI offline, backup check used

Saved runs used the offline backup check, not an AI model. The learning shown is the real mechanism: feedback, then memory, then a changed outcome.

One SQL question across private and public data.

```
SELECT o.title, r.recall_date, r.recall_url
FROM bundle_pg.amazon_orders o  -- private · Neon
JOIN bundle_live.cpsc_recalls r -- live · CPSC API
  ON lower(o.title) LIKE '%' || lower(r.product) || '%'
WHERE o.family_id = 'maya'
```

1 row

KEAWIS Crib Mattress · in the fake family's orders · real CPSC recall #26191, Jan 15, 2026

Simplified from the Spike 0 query. No data copied: the recall list is read live, so it is never stale.

739 live recall records read in one query

1 / 0 correct match / false matches

~2s per query once warm (6s cold)

Same pattern powers every agent: FSA list × card spending, store policies × prices, benefit rules × birth date.

Run 2 is smarter than run 1.

Run 1

Court approves a "free" membership

No case law yet. Offline screen finds no flagged terms.

→

Parents

"It charged me after 30 days."

Two or more parents tap "Report issue."

→

Coach → H-MEM

Rule mem-1

```
Reject offers whose free
trial renews as a paid
membership.
confidence: 0.8
approved: reviewer
```

→

Run 2

Judge cites mem-1 and blocks the same offer

Same code. New outcome, from memory.

Stored and loaded

Relevant rulings are pulled into the Judge's instructions before it rules. Memory nobody reads is decoration.

Confidence that moves

Each rule carries its source and a confidence score (0.8 for mem-1).

Audit trail

Every memory call is one line in the trace. Run 1, approval and run 2 traces ship in the repo.

```
// saved traces, output_examples/learning/ (agent · action · result · status)
run1 · judge · rule_by_screen · "approve: Offline screen: no flagged terms found." · fallback
approve · memory · add_rule · "stored mem-1 from case_law:1" · confidence 0.8 · ok
run2 · memory · recall_rules · "1 rule(s)" · confidence 0.8 · ok
run2 · judge · rule_by_screen · "reject: ... Reject offers whose free trial turns into a paid membership ... [cited mem-1]" · blocked
```

Saved runs used offline fallbacks (no AI model), so the rule text is one of two pre-written sentences. Shows the mechanism, not AI-written rules.

WHAT'S UNIQUE ABOUT OUR SPONSOR TECH

Take either one away and Bundle stops working.

Zetaris

Without it: zero personalized cards.

Private × public in one query. Family spending joined to rules and live recalls.

A view per agent. The Judge never sees family income.

An independent check. The Fact-Checker writes its own query.

Data-quality rule. No source link, no card.

```
judge's view: offer · fine print · baby age ✓
family income · bank details ✗ not visible
```

Meterless H-MEM

Without it: the court never learns.

Parent feedback becomes a rule with source and confidence.

Loaded, not just stored. The Judge recalled it and cited it.

A human approves before a rule becomes permanent.

Readable trace of every memory call.

```
mem-1 · confidence 0.8 · source: case_law:1
approved by a reviewer before it counts
```

NVIDIA-hosted Nemotron models are supported by the app; the saved results here ran offline and did not exercise them yet.

TECHNICAL STACK

Built to be checked.

AI models (supported)
NVIDIA Nemotron-ready

Data door
Zetaris

Memory
Meterless H-MEM

Database
Neon Postgres

Live public data
CPSC · openFDA

App
React + Express · Claude Code

3 fake test families, 3 different feeds

Maya
MA · day 20 · card + orders

Leo
MA · due soon · no data

Ava
Ohio · day 60 · card only

Code does math. AI explains and argues.

Dollar amounts and deadlines come from SQL, so the AI can't invent numbers.

A trace for every run

JSON log of each agent step, query and memory read. Judges can call `POST /api/run`.

Eval scoreboard (saved run, Oct 23)

6/6
planted traps caught

0
false alarms

100%
cards sourced

Learning: run 1 approved, run 2 blocked citing mem-1. Traps: auto-renew offer, wrong-amount row, recalled item, refund, duplicate, out-of-state family. Honest note: ran offline (no AI model); model quality is not measured here.

Fails safe

Court fails closed. Saved recall copy if the live feed breaks. Sample mode runs with sample inputs, never pre-written answers.

Declared pre-existing: open-source app template; Meterless engine code vendored from its public repo.

FUTURE ENHANCEMENTS

Next: from “found” to “done.”

01

Pre-filled applications

Form 4547, MA paid leave. Agents fill them in and stop before submitting.

02

Live bank + Amazon connect

Today: Plaid-format sample data. Next: live Plaid and order uploads.

03

Watching in the background

Price drops inside refund windows, new recalls, new deadlines, as they happen.

04

Every state, fair pricing

Beyond Massachusetts. A success fee: families pay only when money comes back.

bundle.

Tap "Try as guest." No sign-up.

The north star: Estonia offers family benefits automatically once a birth is registered. Bundle brings that to US parents.
