bundle. Track 1: Solving Fragmented Intelligence

A baby's first year costs $20,400. The help is scattered.

Benefits + deadlines

$2,200 tax credit, $1,000 Trump Account, paid leave

Each on a different site. Insurance must add the baby within 30 to 60 days.

Fine print

"Free" boxes that become $29.99 a month

Registry perks hide auto-renewing memberships and fees.

Recalls

Split across multiple government data sets

Only 42% of parents register their car seat, so most never hear of a recall.

Our user A new parent, expecting or in the first 100 days. Example: made-up "Baby Maya, day 20", Boston.

Sources: BabyCenter cost survey (first year) · Safe Kids Worldwide 2015 (car-seat registration) · IRS and Mass.gov 2026 figures. Links: research/research-boston-baby-benefits.html

bundle.

Helping new parents save time and money.

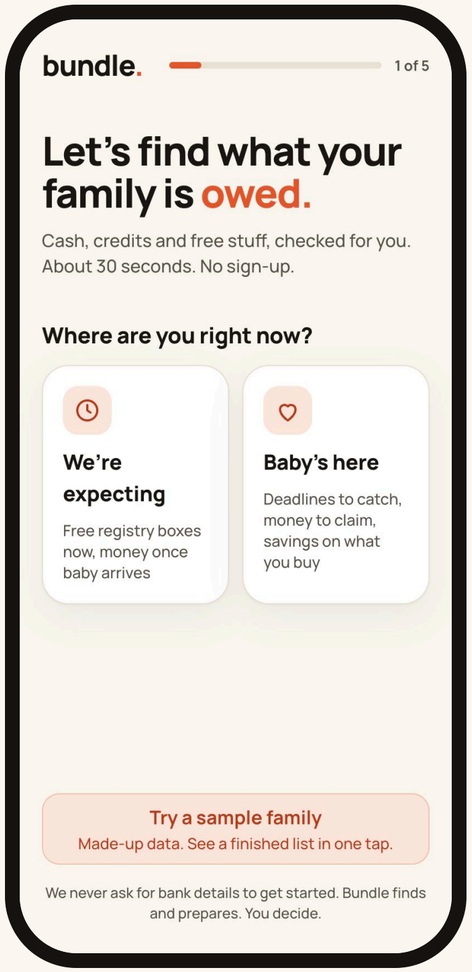

AI agents find what a family is owed, check every claim against its source, and learn from parent feedback.

Money back · FSA/HSA items, store price drops

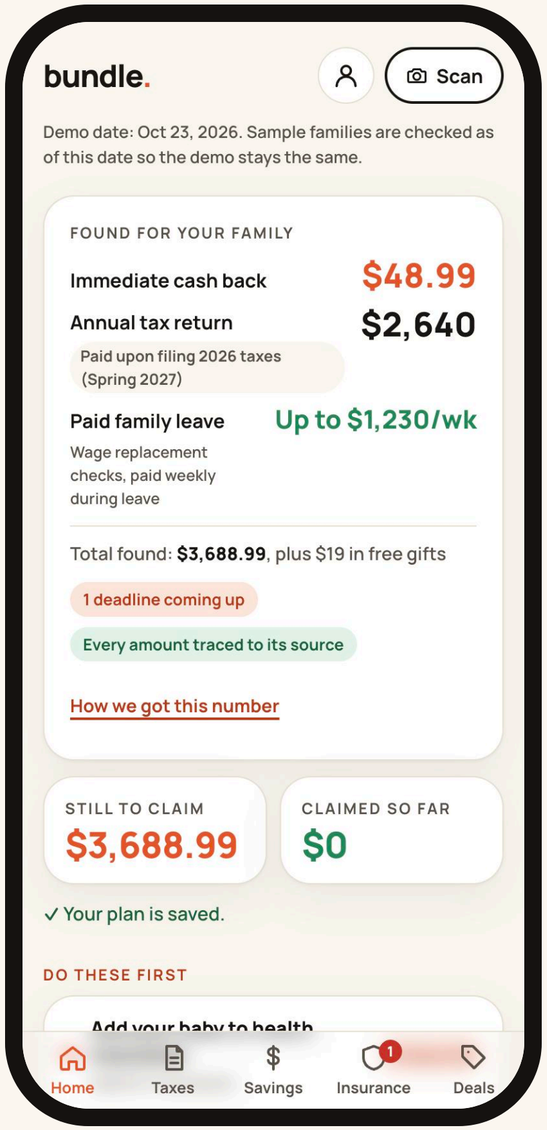

Benefits · tax credits, paid leave, deadlines

Recalls · her gear against live recall lists

Deals · fine print read, traps blocked

1 · Five quick questions

2 · What she's owed

Agents that check each other.

Sponsor tech: ZETARIS · METERLESS · NVIDIA

NVIDIA

AGENTS · RUN SIDE BY SIDE

- **Clawback Hunter** — money back
- asks →
- **Recall Checker** — CPSC · FDA · NHTSA
- **Benefits Planner** — benefits + deadlines
- ↔ challenges
- **Lawyer** — tries to disprove it
- **Fine Print Court** — Deal hunter argues for · fine-print lawyer argues against
  Judge rules: traps are rejected

The AI they use
NVIDIA
Nemotron models argue, explain and read photos. Code does the math.

ROUTED BY
Nightshift
Meterless's AI switchboard on our Mac; else NVIDIA

Fact-Checker · the gate
Re-asks Zetaris for every amount and date.
No source link, no card.

Wrong? Sent back to the agent that made it (max 2), then dropped.

Parent's feed
only cards that passed the gate

Loop 2 · graded deals saved and reused, for every family

Loop 1 · parent reports → Coach proposes a rule → a person approves

ZETARIS — the data door: one SQL question, many sources

Joins a family's private data (Neon Postgres: answers, photo rows, saved deal grades) with live CPSC and FDA recall feeds in one query. Every agent and the Fact-Checker read through it.

METERLESS — H-MEM: shared memory

Agents' notes to each other (claim, question, answer, correction, verdict) · rules parents taught it · a memory of each family that grows with every answer and scan.

TECHNICAL STACK

Built to be checked.

Deal search
Tavily web search

App
React + Express (TypeScript) · hosted on Render · built with Claude Code

Code does the math. AI argues and explains.

Amounts and deadlines come from SQL. An AI sentence with a dollar figure it wasn't given is thrown away.

Answer-key test (eval)

8/8
planted traps caught

0
false alarms

100%
cards with a source

Saved runs used practice mode (AI off), so they show the checks work, not AI quality.

SPONSOR TECHNOLOGY

Take one away and Bundle stops working.

ZETARIS

One SQL door over private and public data

```
SELECT item, recall_title
FROM v_purchase_items -- her photos
JOIN cpsc_recalls -- live feed
```

The Fact-Checker re-asks it for every number. The deal court's view has no family data.

Without it: no personal cards at all.

METERLESS

H-MEM: memory that grows

- Agents' notes to each other, every run
- Rules parents taught it, which the judge must cite
- A memory of each family: answers and every scanned item

Nightshift: AI switchboard

First choice for AI calls on our Mac; forwards to NVIDIA.

Without it: the court never learns.

NVIDIA

Nemotron + vision models

- Vision reads gear labels and receipts
- Nemotron argues over fine print and explains results
- The live demo calls NVIDIA directly

Without it: no photo reading; the court falls back to a plain rule screen.

WHAT WAS UNIQUE

Every photo, parent and deal makes it smarter.

01 · Zetaris + NVIDIA

A photo becomes data

Snap a car-seat label or receipt. Vision AI turns it into rows (model, UPC, price) that Zetaris joins to live recall lists in one question.

Drawn test label: Britax seat → found on NHTSA recall 12C004000

02 · Meterless H-MEM

A family memory that grows

Every answer and every scanned item is remembered, so each new run knows more. Parents see it in plain words: "Has: City Stroller".

Account tab · "What we know about your family"

03 · Agent collaboration

Agents argue, check and learn

The court debates deals, a lawyer challenges benefits, the Fact-Checker sends wrong cards back. Parent reports become rules: run 1 approves a trap, run 2 blocks it.

Learning test: run 2 blocks the trap, citing the rule (mem-28)

04 · A dataset the agents build

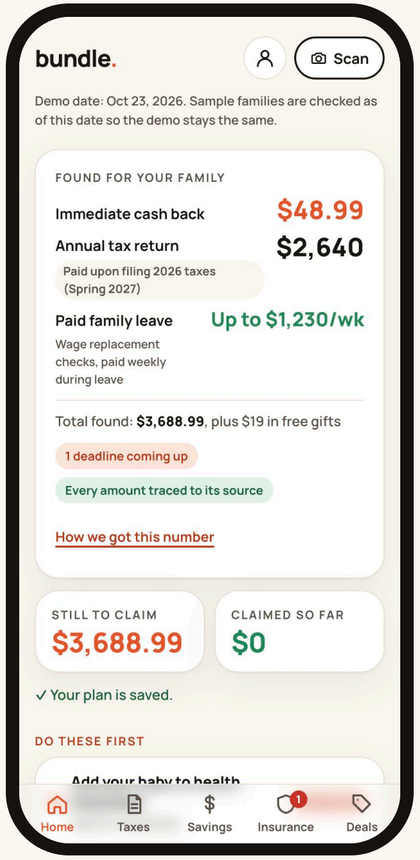

Graded deals become an API

Each graded deal is saved with its catches, with no family data. The app reuses it for every family, and a public API reports catch rates by store. A product we could sell.

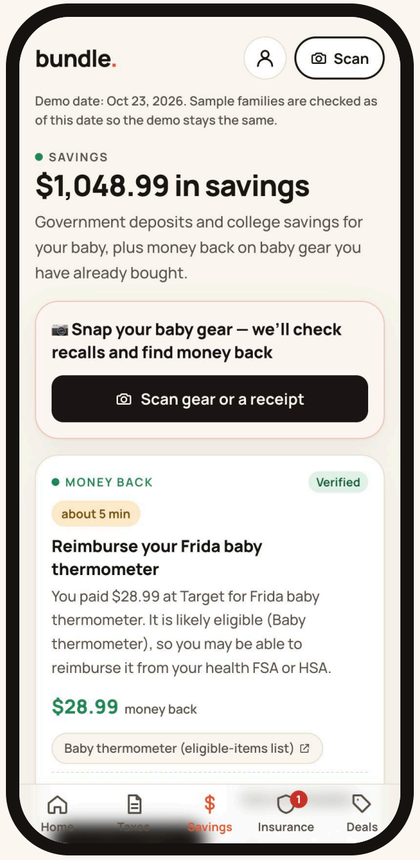

```
GET /api/offer-audit?store=Amazon
```

THE PRODUCT

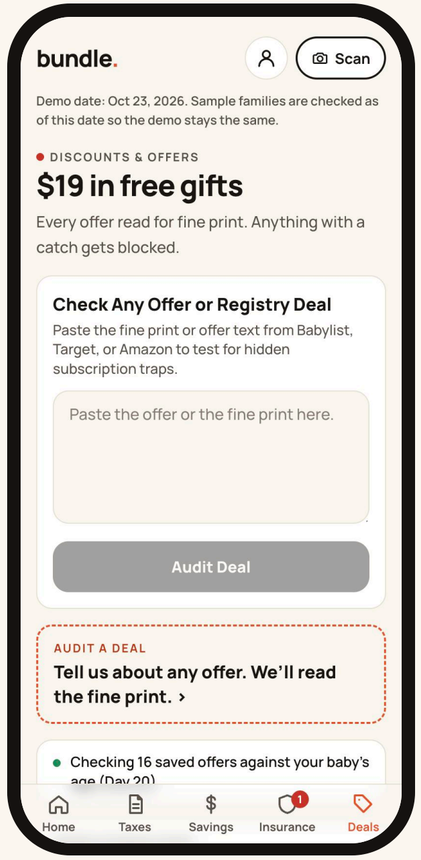

Every card shows its work.

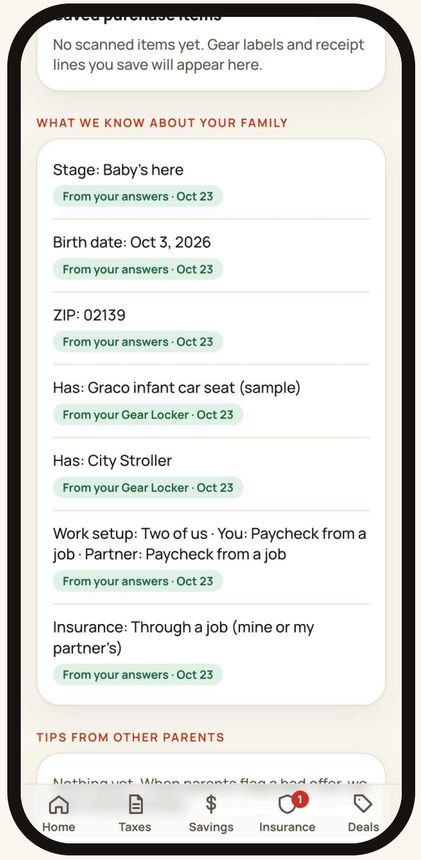

Money found, in three buckets

Scan gear · money back, with source

Audit any deal's fine print

What Bundle remembers

FUTURE ENHANCEMENTS

Next: from “found” to “done.”

01

Grow with the child

The family memory keeps going: daycare, first bike, college savings.

02

Every state, always watching

All 50 states. Automatic re-checks for new recalls and price drops.

03

Pre-filled forms

Agents fill in benefit applications and stop before submitting.

04

Sell the deal-check API

Retailers and registries check their perks before publishing.
