Open Agent Hackathon 2026 · Track 1: Solving Fragmented Intelligence

bundle.

Your first 100 days, checked.

Money back, recalls, benefits and deals for new parents. Snap a label or a receipt. A team of AI agents checks every claim, and argues over every deal, before a parent sees it.

SLOT screenshot-title · Oct 23 screenshot, replace with V2

Solo build by Lyndsay Kerwin · Sponsor tech: Zetaris + Meterless · AI: NVIDIA · Built with Claude Code · All families shown are made up

THE PROBLEM

New parents leave money and safety on the table.

$441

lost per FSA holder who forfeits

About half of FSA (tax-free health account) holders lose money every year. Top reason: not knowing what counts.

~40%

of recalled car seats ever get fixed

Only 42% of parents register their seat, so most never hear about a recall.

$20.4k

what a baby's first year costs

Every missed refund, benefit or deadline comes out of this. BabyCenter survey of 1,399 moms.

And 2026 rewrote the rules: $1,000 Trump Account · $2,200 child tax credit · $7,500 dependent-care FSA limit · $440 MA child credit

Sources: EBRI via Retail Dive (FSA) · Safe Kids Worldwide (car seats) · BabyCenter 2025 cost survey (first year) · IRS 2026 adjustments, Axios, HWH Law, Mass.gov via Kiplinger (2026 rules). Links: research/research-boston-baby-benefits.html.

What Maya's family is owed is scattered across five places.

Her own stuff
Gear + receipts
A car-seat label with a lot code. A pharmacy receipt with tax-free items.

Her employer
Benefits plan
30-day windows for insurance and dependent-care FSA.

IRS + Massachusetts
2026 rules
Rewritten this year. Most parents' info is stale.

CPSC · FDA · NHTSA
Recalls
Updated constantly. A week-old copy is dangerous.

Store sites
Deal fine print
A "free" diaper box that becomes a $29.99 a month membership.

Sample family (made up)
Baby Maya, day 20

Boston, MA. Parent works full-time with employer benefits. Nobody joins these five sources for her.

Insurance window: 10 days left

For: a parent who is expecting or within 100 days of a birth. Demo state: Massachusetts; federal items work everywhere.

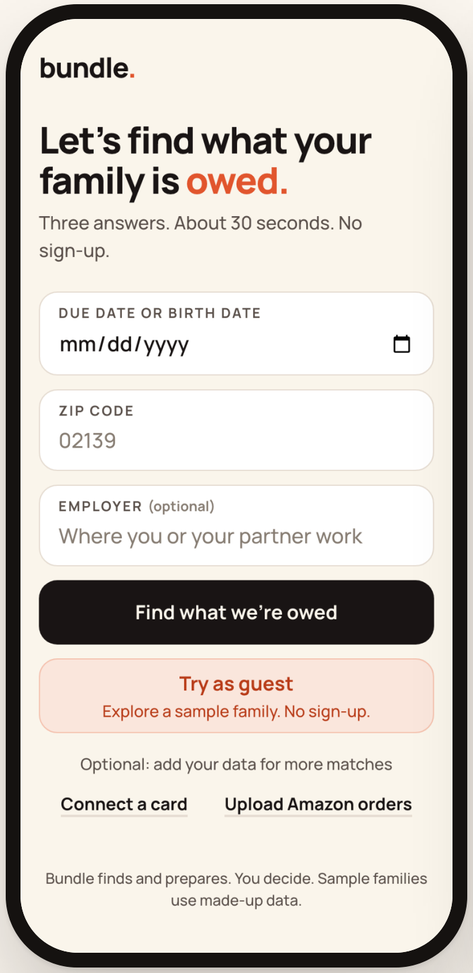

THE PRODUCT

One screen. Everything she's owed.

A few questions, or try as a guest. Snapping a receipt or a label makes it sharper.

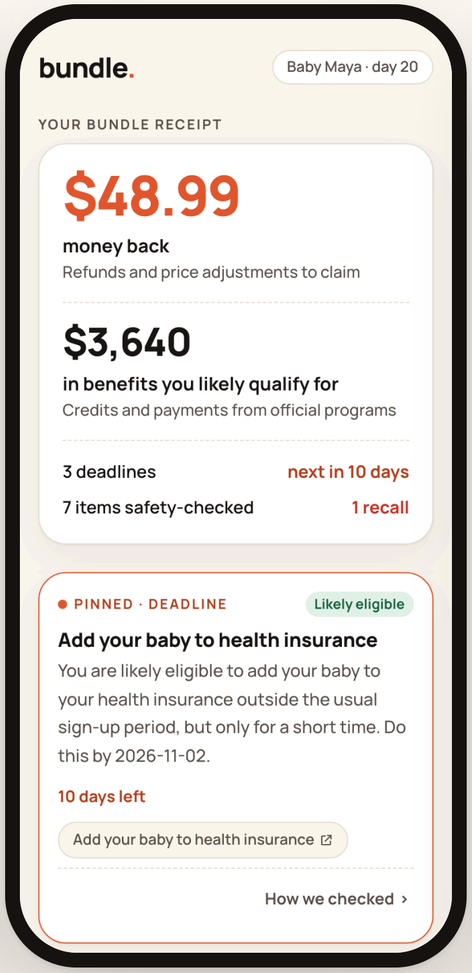

- **Money back** · FSA claims, store price drops
- **Recalls** · her gear against live recall lists
- **Benefits + deadlines** · dated countdowns
- **Deals** · graded by Fine Print; unchecked ones say "Not yet verified"

Every card shows its work: the source link and how it was checked.

3 · How we checked

SLOT screenshot-how-we-checked

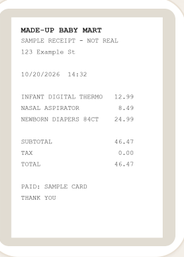

Made-up sample family. **Screens are Oct 23 builds: replace all three after today's app changes land**

NEW WAY TO ADD DATA · THE PHOTO READER

Snap a photo. Agents get clean data.

BEFORE: A PHOTO

Or a paper receipt. This made-up one became **3 rows**: thermometer $12.99, nasal aspirator $8.49, diapers $24.99, dated Oct 20, 2026.

NVIDIA vision AI reads it

→

plain code checks every field

AFTER: A ROW AGENTS CAN USE

PRODUCT	**Infant Car Seat**
BRAND	**Graco**
MODEL NUMBER	`SAMPLE-1042` · seen in the photo text
MADE ON	`2026-03-15` being added Oct 26
LOT CODE	`SMP-0315`
UPC (BARCODE NUMBER)	`012345678905` · check digit adds up
PRICE	**from receipts**

The AI can't invent a code: every code must appear in the text it read. Only product fields are kept, so card numbers, names and addresses never get saved. Unclear? One retry with the exact problems, then "please send a clearer photo."

Both photos are made up. Real NVIDIA answers recorded Oct 25 (bundle/data/sample/vision-cache). Free NVIDIA vision is often busy; the app says so instead of guessing. Code: bundle/server/ingest/photo.ts

WHAT ONE PHOTO POWERS

One photo, four jobs. No typing.

Saved as rows in

`purchase_items`

The only purchase list the agents read. Photo itself is not kept; a small thumbnail is, with location data removed.

Instant recall check

Car seats against NHTSA's 69 car-seat recalls; everything else against CPSC through Zetaris. Says "found", "No recalls found" or "could not check". Never "safe".

Money-back check

Each receipt line is checked right away: can it be paid back from an FSA or HSA (tax-free health accounts)?

Gear Locker

Her saved gear and receipts, with pictures. Also remembered in Meterless memory: "Has: Infant Car Seat".

Every later agent run

ClawbackHunter and RecallChecker read the same rows through Zetaris each run, so a new recall finds old gear.

Other ways data gets in today: Paste fine print or a screenshot into Audit-a-deal · Live deal search of trusted sites · Parent taps: Got it · Not relevant · Report issue · A few onboarding questions · Live CPSC + openFDA recall feeds

Design, being built Oct 26: photos are read in the background, so a parent can keep using the app while it reads. Update when it lands.

Code: bundle/server/routes/photoRoutes.ts · ingest/gearRecall.ts · offers/dealAudit.ts · offers/liveSearch.ts

THE AGENT TEAM

Specialists that check each other's work.

Orchestrator (plain code) · loads the family through Zetaris · runs 4 agents at once · 300-second budget · never-empty feed · writes the trace

DATA COMING IN

PhotoReader
label or receipt → rows

Live deal search
trusted baby-deal sites

Audit-a-deal
parent pastes fine print

Parent taps
Got it · Not relevant · Report

CoachAI between runs
2+ reports on one theme → proposes a rule → a person approves → saved to memory

AGENTS (RUN SIDE BY SIDE)

ClawbackHunter
Money back: FSA/HSA items and store price drops
asks RecallChecker first →

RecallChecker
Her items × live CPSC + FDA recalls; code match rules (UPC, model, lot first)
can kill a deal

BenefitsPlanner
Rules + birth date + state → dated deadlines
Eligibility Lawyer
counter-question · can drop

Fine Print (agent name: FinePrintCourt) · grades up to 5 deals a run

Newsroom step
reads saved grades (Zetaris) and lessons (memory). Same wording as before? Reuse it, skip the AI.

Deal Hunter vs Fine Print Lawyer
Judge rules

Code screen
grades too. Disagree? 1 rebuttal. Stricter wins.

THE GATE

FactChecker
Re-checks every amount and date with its own data question. No source link, no card.

Wrong number? Sent back to the agent that made it (max 2), then dropped.

Parent's feed
only cards that passed the gate

Zetaris · the data door
One SQL question joins private family data with live public feeds. Each agent reads through a limited view: the Judge never sees family data.

Meterless H-MEM · shared memory
Approved rules ("case law") the Judge must cite · one shared workspace per run for agent notes · graded lessons from past grades · each family's saved gear

Names as they appear in the logs. Code: bundle/server/agents/ (orchestrator, clawback, recall, benefits, eligibilityLawyer, finePrintCourt, newsroom, factChecker, coach) · ingest/photo.ts · offers/

HOW THE AGENTS TALK

They leave each other notes. Every one is logged.

Channel 1

A shared workspace

One per run, stored in Meterless memory. Five kinds of note: **claim, question, answer, correction, verdict**, each with who sent it and who it is for.

Channel 2

Direct hand-offs

Every card goes to the FactChecker; a wrong one goes back to the agent that made it.

Channel 3

A trace anyone can replay

A 10-field log line for every step, including `target_agent` (who it went to). Readable at `GET /api/runs/:id/agent-log`.

REAL NOTES FROM ONE SAVED RUN · OCT 25, 23:51 UTC · MADE-UP FAMILY "AVA"

ClawbackHunter → RecallChecker	question	"Is 'Infant Tylenol and saline drops' under a CPSC or FDA recall? I am about to publish a reimbursement on it."
RecallChecker → ClawbackHunter	answer	"No open CPSC or FDA recall matched 'Infant Tylenol and saline drops'."
BenefitsPlanner → FinePrintLawyer	claim	"Likely eligible: Federal Child Tax Credit."
FinePrintLawyer → BenefitsPlanner	question	"Shown at a fixed amount. Does the federal tax table for the baby's year give the same…"
FinePrintLawyer → BenefitsPlanner	verdict	"confirmed: tax table (2026) agrees on the amount"
FactChecker → ParentFeed	approve	benefit card federal_child_tax_credit: "verified"

Source: bundle/logs/run_bundle_ava-6d675925….jsonl · code: agents/workspace.ts, agents/trace.ts. The FactChecker's "correction" note is built and passes tests (factChecker.test.ts, loopsEndToEnd.test.ts) but has not fired in a saved run yet.

AGENTS THAT CHALLENGE EACH OTHER

Deals get a real argument.

REAL AI DEBATE · "FREE" NEWBORN DIAPER BOX (OFFER 1318) · OCT 25, 04:29 UTC

Deal Hunter ARGUES FOR	"…a good deal for a new parent… The free newborn diaper box is a thoughtful gift…"
Fine Print Lawyer ARGUES AGAINST	"…requires a card on file… automatic enrollment in a paid membership after a 30-day…"
Judge RULES	**Reject.** "…auto-enrolls users into a $29.99/month paid membership after 30 days, making it not truly free…"
Disagreement REBUTTAL 1 OF 1	The code screen said approve; the Judge said reject. Both sides answer once more.
Deal Hunter REBUTTAL	"…concede that the offer is not truly free."
Judge RULES AGAIN	**Reject** stands. Still disputed with the code screen, so the grade is **not saved** for reuse.

The rules of the debate

The AI Judge and a plain-code screen both grade. If they disagree: one rebuttal round, then the Judge rules again. A code "reject" always stands. A grade both sides don't agree on is never saved.

Safety gate

ClawbackHunter asks RecallChecker before showing money back on an item. Recalled? The deal is killed.

Counter-question

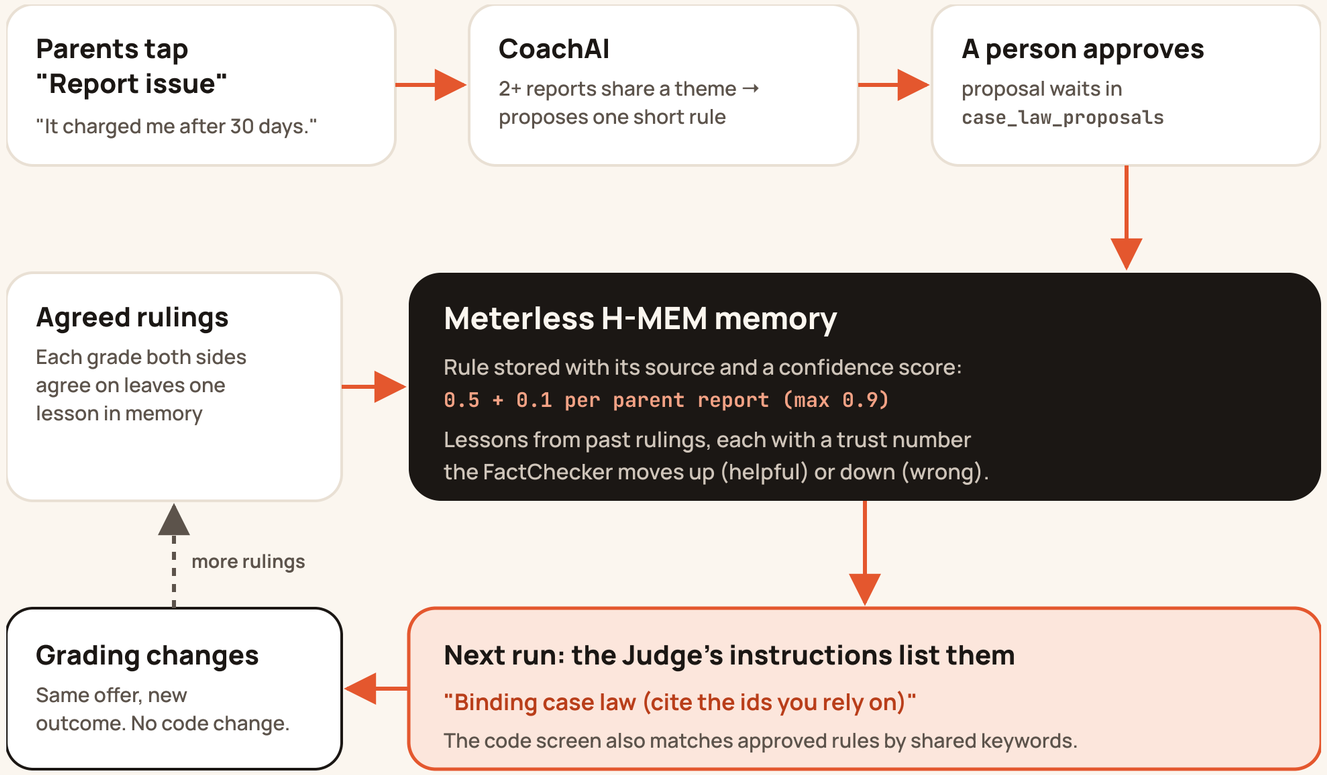

The Eligibility Lawyer tries to disprove each benefit with one data question: confirmed, dropped, or "Not yet verified".

Send-back

FactChecker returns a wrong amount or date with the exact line, max 2 rounds. Tested; not yet seen in saved logs.

Quotes trimmed from bundle/logs/run-ava-1fcffa7e….jsonl (a run with the AI on). Only deals are debated; benefits get a counter-question; money back and recalls are fact-checked.

Rulings and parent reports become rules.

Same offer marked "Not relevant" by 2+ families → Coach proposes re-checking who it is for.

PROOF: EVAL SCOREBOARD, OCT 25

Run 1

Court **approves** a "free" trial that renews as a paid membership.

Parents + reviewer

Reports → Coach rule → a person approves → saved as `mem-28`.

Run 2

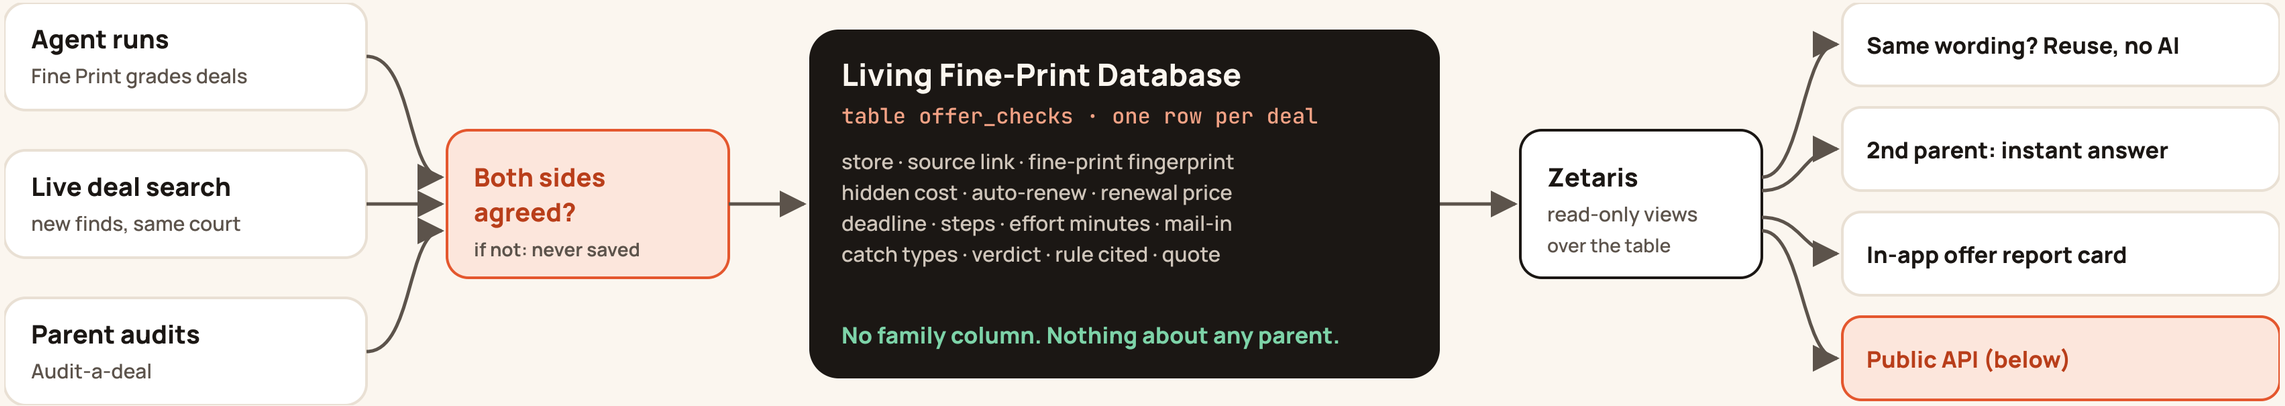

Same offer **blocked, citing mem-28**. 0 other offers wrongly blocked.

Honest note: this eval ran in practice mode with the AI off, so the court used its plain-code backup. The learning path is the same.

Code: agents/coach.ts (confidenceFor) · routes/bundleRoutes.ts (POST /api/case-law/:id/approve) · agents/finePrintCourt.ts · agents/newsroom.ts · bundle/logs/scoreboard.json

FEEDBACK LOOP 2 · ACROSS EVERY FAMILY

Every graded deal feeds a shared fine-print database.

An API other parent apps could use

```
GET /api/offer-audit?store=Amazon
{ "status": "found", "brands": [ { "store": "Amazon",
  "offersChecked": 3, "offersCaught": 2, "catchRate": 0.667 } ] }
```

Public, read-only, rate-limited. Fields are copied one by one so no family data can leak. With nothing saved it says "none", never invents rows. Described in a standard OpenAPI file: `bundle/docs/openapi/offer-audit.yaml`.

Honest size today

Recorded answer (Oct 25): **12 deals graded, 7 brands, 7 had a catch**. Amazon 2 of 3 · Enfamil 2 of 2 · Walmart 1 of 2 · Babylist 1 of 1 · Similac 1 of 1 · Pampers 0 of 2 · Target 0 of 1.

FINAL ROW COUNT after Oct 26 re-grading: [____] deals · [____] brands

Small and new. Runs on our own server today; no outside app uses it yet.

Code: shared/schema.ts (offer_checks) · agents/offerChecks.ts ("agreed" only) · agents/savedVerdicts.ts · routes/offerAuditRoutes.ts · routes/offerRoutes.ts (report card, Audit-a-deal)

Without Zetaris: zero personalized cards.

THE RECALL QUESTION RECALLCHECKER ASKS TODAY (SIMPLIFIED)

```
SELECT i.item_text, r.recall_title, r.recall_url
FROM bundle_pg.v_purchase_items i
  -- private · Neon · includes photo rows
JOIN (cpsc_recalls UNION ALL fda_food_recalls) r
  -- live · read from CPSC + openFDA, no copy
  ON r.recalled_product LIKE '%' || i.upc || '%'
 OR r.recalled_product LIKE '%' || i.lot_code || '%' …
WHERE i.family_id = :family
```

A photo snapped today becomes a row that one question can join to a live government recall list. Simplified from `pairsSql` in agents/recall.ts.

EVERY AGENT GOES THROUGH THE SAME DOOR

A limited view per agent. The Judge's view holds the offer and fine print, never family data.

An independent check. The FactChecker asks its own question, e.g. `SELECT value_cents … FROM v_judge_offers WHERE id = 1318`.

Memory of past grades. The Newsroom step reads saved verdicts before any AI is called.

Counter-questions. The Eligibility Lawyer checks benefits against state and tax tables.

The public API and the Coach's view of parent reports.

Spike 0 (Oct 23): 739 live recall records read in one query, ~2 s once warm. Data-quality rule across all agents: no source link, no card.

Without Meterless: the court never learns.

H-MEM · case law

Approved rules the Judge must cite

Stored with source and confidence; a person approves first. Loaded into the Judge's instructions, not just stored.

H-MEM · run workspace

Where agents leave each other notes

One per run: claim, question, answer, correction, verdict. Shown in the app's Agent Workspace panel.

H-MEM · graded lessons

Past rulings with a trust number

The FactChecker marks each lesson the court used as helpful or wrong, so trust moves with results.

H-MEM · family memory

What this family already owns

Scanned gear is remembered ("Has: Infant Car Seat"), so later runs know about it.

Nightshift: the app's first-choice route to an AI model when it runs on the Mac; NVIDIA Nemotron directly is the backup. **Not used:** Scout Intent.

```
mem-28 · confidence = 0.5 + 0.1 × reports (max 0.9)
every memory call is one line in the trace
```

Code: agents/workspace.ts · agents/newsroom.ts · agents/factChecker.ts · routes/photoRoutes.ts (rememberGear) · adapters/llm.ts (provider order). Meterless engine code vendored from its public repo.

Automated tests
1,194 pass, 0 fail last full run Oct 26: re-run before submitting

Code does the math. AI explains and argues.

Amounts and deadlines come from SQL. If the AI's sentence mentions a dollar figure it wasn't given, the sentence is thrown away.

Eval scoreboard (Oct 25)

8/8	0	100%
planted traps caught	false alarms	cards sourced

3 runs, same result each time. Traps include an auto-renew offer, a wrong amount, a recalled item, a duplicate, an out-of-state family and look-alike products. Honest note: practice mode, AI off; model quality is not measured here.

Fails safe

Unsure grades are not saved. A recall check that can't run says "could not check", never "safe". A busy photo reader says so instead of guessing.

Scoreboard: bundle/logs/scoreboard.json. Declared pre-existing: open-source app template; Meterless engine code vendored from its public repo.

FUTURE ENHANCEMENTS

Next: from “found” to “done.”

01

More ways in

Email receipts and barcode scanning. Not built yet; the data model already has a place for them.

02

Pre-filled applications

Form 4547, MA paid leave. Agents fill them in and stop before submitting.

03

Open the fine-print API

Host it with keys so other parent apps can ask "is this deal what it says?"

04

Watching, every state

Scheduled re-checks for new recalls and price drops. Beyond Massachusetts. A success fee: pay only when money comes back.

bundle.
